

简谐运动的基本特征

3、能量特征

$$E = \frac{1}{2}mv^2 + \frac{1}{2}kx^2 = \frac{1}{2}kA^2$$

2、动力学特征 $\ddot{x} + \omega^2 x = 0$

$$\omega = \sqrt{\frac{k}{m}}$$

1、运动学特征 $x = A\cos(\omega t + \varphi)$

振动合成

一、两个同方向同频率简谐振动的合成

*三、多个同方向同频率简谐运动的合成

四、两个同方向不同频率简谐运动的合成

二、两个相互垂直的同频率的简谐运动的合成

一 两个同方向同频率简谐运动的合成

设一质点同时参与
两独立的同方向、同频
率的简谐振动：

$$x_1 = A_1 \cos(\omega t + \varphi_1)$$

$$x_2 = A_2 \cos(\omega t + \varphi_2)$$

两振动的位相差 $\Delta\varphi = \varphi_2 - \varphi_1 = \text{常数}$

$$x = A \cos(\omega t + \varphi)$$

$$\left\{ \begin{aligned} A &= \sqrt{A_1^2 + A_2^2 + 2A_1A_2 \cos(\varphi_2 - \varphi_1)} \\ \tan \varphi &= \frac{A_1 \sin \varphi_1 + A_2 \sin \varphi_2}{A_1 \cos \varphi_1 + A_2 \cos \varphi_2} \end{aligned} \right.$$

两个同方向同频率简谐运动合成后仍为同频率的简谐运动

(1) 相位差 $\Delta\varphi = \varphi_2 - \varphi_1 = \pm 2k\pi$ ($k = 0, 1, 2, \dots$)

(2) 相位差 $\Delta\varphi = \varphi_2 - \varphi_1 = \pm(2k+1)\pi$ ($k = 0, 1, 2 \dots$)

小结

(1) 相位差 $\varphi_2 - \varphi_1 = \pm 2k\pi$ ($k = 0, 1, 2, \dots$)

$$A = A_1 + A_2$$

加强

(2) 相位差 $\varphi_2 - \varphi_1 = \pm(2k+1)\pi$ ($k = 0, 1, 2, \dots$)

$$A = |A_1 - A_2|$$

减弱

(3) 一般情况

$$A_1 + A_2 > A > |A_1 - A_2|$$

例、两个同方向、同频率简谐运动方程分别为

$$x_1 = 0.4 \cos\left(3t + \frac{\pi}{3}\right) \text{ m}$$

$$x_2 = 0.3 \cos\left(3t - \frac{\pi}{6}\right) \text{ m}$$

求 (1) 合振动表达式

(2) 若另有一简谐运动 $x_3 = 0.5 \cos(3t + \varphi)$,
当 φ 等于多少时 $x_1 + x_3$ 的振幅最大?

解：(1) 本题可用解析法和旋转
矢量法求出，由图示旋转矢量
图（ $t=0$ 时刻），知 $\vec{A}_1$ 和 $\vec{A}_2$ 夹
角为 $\pi/2$ 则合振幅为

$$A = \sqrt{A_1^2 + A_2^2} = 0.5m$$

$$\text{初相位 } \varphi = \frac{\pi}{3} - \alpha = 0.12\pi$$

$$\therefore x = 0.5 \cos(3t + 0.12\pi)$$

$$\text{可由 } A = \sqrt{A_1^2 + A_2^2 + 2A_1A_2 \cos(\varphi_2 - \varphi_1)}$$

$$\text{和 } \varphi = \text{tg}^{-1} \left(\frac{A_1 \sin \varphi_1 + A_2 \sin \varphi_2}{A_1 \cos \varphi_1 + A_2 \cos \varphi_2} \right)$$

求得相同结果。

(2)要使 $x_1 + x_3$ 的振幅最大

$$\Delta\varphi = \varphi - \varphi_1 = 2k\pi$$

$$\therefore \varphi = \varphi_1 + 2k\pi = \frac{\pi}{3} + 2k\pi$$

$$(k = 0, \pm 1, \pm 2, \cdots)$$

*三 多个同方向同频率简谐运动的合成

$$\left\{ \begin{array}{l} x_1 = A_1 \cos(\omega t + \varphi_1) \\ x_2 = A_2 \cos(\omega t + \varphi_2) \\ \dots\dots\dots \\ x_n = A_n \cos(\omega t + \varphi_n) \end{array} \right.$$

$$x = x_1 + x_2 + \dots + x_n$$

$$x = A \cos(\omega t + \varphi)$$

多个同方向同频率简谐运动合成仍为简谐运动

$$\begin{cases} x_1 = A_0 \cos \omega t \\ x_2 = A_0 \cos(\omega t + \Delta\varphi) \\ x_3 = A_0 \cos(\omega t + 2\Delta\varphi) \\ \dots\dots\dots \\ x_N = A_0 \cos[\omega t + (N-1)\Delta\varphi] \end{cases}$$

$$x = A \cos(\omega t + \varphi)$$

$$A = A_0 \frac{\sin(\frac{N\Delta\varphi}{2})}{\sin(\frac{\Delta\varphi}{2})}$$

$$\varphi = \frac{N-1}{2} \Delta\varphi$$

$$x = A \cos(\omega t + \varphi)$$

$$A = A_0 \frac{\sin(\frac{N\Delta\varphi}{2})}{\sin(\frac{\Delta\varphi}{2})}$$

$$\varphi = \frac{N-1}{2} \Delta\varphi$$

讨论

$$(1) \Delta\varphi = 2k\pi$$
$$(k = 0, \pm 1, \pm 2, \dots)$$

$$(2) N\Delta\varphi = 2k'\pi$$
$$(k' \neq kN, k' = \pm 1, \pm 2, \dots)$$

四 两个同方向不同频率简谐运动的合成

频率较大而频率之差很小的两个同方向简谐运动的合成，其合振动的振幅时而加强时而减弱的现象叫拍。

$$\begin{cases} x_1 = A_1 \cos \omega_1 t = A_1 \cos 2\pi \nu_1 t \\ x_2 = A_2 \cos \omega_2 t = A_2 \cos 2\pi \nu_2 t \end{cases}$$

$$x = x_1 + x_2$$

讨论 $A_1 = A_2$, $|\nu_2 - \nu_1| \ll \nu_1 + \nu_2$ 的情况

◆ 方法一

$$x = x_1 + x_2 = A_1 \cos 2\pi \nu_1 t + A_2 \cos 2\pi \nu_2 t$$

$$x = \left(2A_1 \cos 2\pi \frac{\nu_2 - \nu_1}{2} t \right) \cos 2\pi \frac{\nu_2 + \nu_1}{2} t$$

振幅部分

合振动频率

振动频率 $\nu = (\nu_1 + \nu_2)/2$

振幅 $A = \left| 2A_1 \cos 2\pi \frac{\nu_2 - \nu_1}{2} t \right|$

$$\begin{cases} A_{\max} = 2A_1 \\ A_{\min} = 0 \end{cases}$$

$$x = (2A_1 \cos 2\pi \frac{\nu_2 - \nu_1}{2} t) \cos 2\pi \frac{\nu_2 + \nu_1}{2} t$$

$$2\pi \frac{\nu_2 - \nu_1}{2} T = \pi \quad \longrightarrow \quad T = \frac{1}{\nu_2 - \nu_1}$$

$$\nu = \nu_2 - \nu_1$$

拍频（振幅变化的频率）

方法二：旋转矢量合成法

$$\varphi_1 = \varphi_2 = 0$$

$$\Delta\varphi = 2\pi(\nu_2 - \nu_1)t$$

振幅 $A = A_1 \sqrt{2(1 + \cos \Delta \varphi)}$

$$= \left| 2A_1 \cos\left(\frac{\omega_2 - \omega_1}{2}t\right) \right|$$

拍频

$$\nu = \nu_2 - \nu_1$$

振动圆频率

$$\cos \omega t = \frac{x_1 + x_2}{A}$$

$$\omega = \frac{\omega_1 + \omega_2}{2}$$

二 两个相互垂直的同频率的简谐运动的合成

$$\begin{cases} x = A_1 \cos(\omega t + \varphi_1) \\ y = A_2 \cos(\omega t + \varphi_2) \end{cases}$$

质点运动轨迹 (椭圆方程)

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} - \frac{2xy}{A_1 A_2} \cos(\varphi_2 - \varphi_1) = \sin^2(\varphi_2 - \varphi_1)$$

讨论

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} - \frac{2xy}{A_1 A_2} \cos(\varphi_2 - \varphi_1) = \sin^2(\varphi_2 - \varphi_1)$$

(1) $\varphi_2 - \varphi_1 = 0$ 或 2π

$$y = \frac{A_2}{A_1} x$$

(2) $\varphi_2 - \varphi_1 = \pi$

$$y = -\frac{A_2}{A_1} x$$

讨论

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} - \frac{2xy}{A_1 A_2} \cos(\varphi_2 - \varphi_1) = \sin^2(\varphi_2 - \varphi_1)$$

(3) $\varphi_2 - \varphi_1 = \pm \pi/2$

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} = 1$$

$$\begin{cases} x = A_1 \cos \omega t \\ y = A_2 \cos(\omega t + \frac{\pi}{2}) \end{cases}$$

用旋转矢量描绘振动合成图

两相
互垂直同
频率不同
相位差简
谐运动的
合成图

一 阻尼振动

现象：振幅随时间减小

原因：阻尼

阻力系数

动力学分析： 阻尼力 $F_r = -Cv$

$$-kx - Cv = ma$$

$$m \frac{d^2 x}{dt^2} + C \frac{dx}{dt} + kx = 0$$

$$m \frac{d^2 x}{dt^2} + C \frac{dx}{dt} + kx = 0$$

$$\rightarrow \frac{d^2 x}{dt^2} + 2\delta \frac{dx}{dt} + \omega_0^2 x = 0$$

欠阻尼: $\omega_0^2 > \delta^2$

$$x = Ae^{-\delta t} \cos(\omega t + \varphi)$$

振幅

角频率

$$\omega = \sqrt{\omega_0^2 - \delta^2} \quad T = \frac{2\pi}{\omega} = 2\pi / \sqrt{\omega_0^2 - \delta^2}$$

固有角频率

$$\omega_0 = \sqrt{\frac{k}{m}}$$

$$\delta = C/2m$$

阻尼系数

$$x = Ae^{-\delta t} \cos(\omega t + \varphi) \quad \omega = \sqrt{\omega_0^2 - \delta^2}$$

三种阻尼的比较

- (a) 欠阻尼 $\omega_0^2 > \delta^2$
- (b) 过阻尼 $\omega_0^2 < \delta^2$
- (c) 临界阻尼 $\omega_0^2 = \delta^2$

临界阻尼应用：

灵敏电流计

电磁阻尼

例 有一单摆在空气（室温为 20°C ）中来回摆动. 摆线长 $l = 1.0\text{ m}$, 摆锤是半径 $r = 5.0 \times 10^{-3}\text{ m}$ 的铅球. **求** (1) 摆动周期; (2) 振幅减小 10% 所需的时间; (3) 能量减小 10% 所需的时间; (4) 从以上所得结果说明空气的粘性对单摆周期、振幅和能量的影响.

(已知铅球密度为 $\rho = 2.65 \times 10^3\text{ kg} \cdot \text{m}^{-3}$, 20°C 时空气的粘度 $\eta = 1.78 \times 10^{-5}\text{ Pa} \cdot \text{s}$)

已知 $l = 1.0 \text{ m}$, $r = 5.0 \times 10^{-3} \text{ m}$, $\rho = 2.65 \times 10^3 \text{ kg} \cdot \text{m}^{-3}$
 20°C , $\eta = 1.78 \times 10^{-5} \text{ Pa} \cdot \text{s}$ 求 (1) T

解 (1) $\omega_0 = \sqrt{g/l} = 3.13 \text{ s}^{-1}$

$$F_r = -6\pi r \eta v = -Cv$$

$$\delta = C/2m = 9\eta/4r^2 \rho = 6.04 \times 10^{-4} \text{ s}^{-1}$$

$$\because \delta \ll \omega_0$$

$$\therefore T = \frac{2\pi}{\sqrt{\omega_0^2 - \delta^2}} \approx \frac{2\pi}{\omega_0} \approx 2 \text{ s}$$

已知 $l = 1.0 \text{ m}$, $r = 5.0 \times 10^{-3} \text{ m}$, $\rho = 2.65 \times 10^3 \text{ kg} \cdot \text{m}^{-3}$
 20°C , $\eta = 1.78 \times 10^{-5} \text{ Pa} \cdot \text{s}$ 求 (2) $A' = 0.9A$, t ?
(3) $E' = 0.9E$, t ?

解(2) 有阻尼时 $A' = Ae^{-\delta t}$

$$0.9A = Ae^{-\delta t_1} \quad t_1 = \frac{\ln(1/0.9)}{\delta} = 174 \text{ s} \approx 3 \text{ min}$$

$$(3) \quad \frac{E'}{E} = \left(\frac{A'}{A}\right)^2 = e^{-2\delta t}$$

$$0.9 = e^{-2\delta t_2} \quad t_2 = \frac{\ln(1/0.9)}{2\delta} = 87 \text{ s} \approx 1.5 \text{ min}$$

二 受迫振动

$$m \frac{d^2 x}{dt^2} + C \frac{dx}{dt} + kx = F \cos \omega_p t$$

驱动力

$$\omega_0 = \sqrt{\frac{k}{m}} \quad 2\delta = C/m \quad f = F/m$$

$$\frac{d^2 x}{dt^2} + 2\delta \frac{dx}{dt} + \omega_0^2 x = f \cos \omega_p t$$

$$\frac{d^2x}{dt^2} + 2\delta \frac{dx}{dt} + \omega_0^2 x = f \cos \omega_p t$$

驱动力的
角频率

$$x = A_0 e^{-\delta t} \cos(\omega t + \varphi) + A \cos(\omega_p t + \psi)$$

$$A = \frac{f}{\sqrt{(\omega_0^2 - \omega_p^2)^2 + 4\delta^2 \omega_p^2}}$$

$$\tan \psi = \frac{-2\delta \omega_p}{\omega_0^2 - \omega_p^2}$$

三 共振

$$\frac{d^2x}{dt^2} + 2\delta \frac{dx}{dt} + \omega_0^2 x = f \cos \omega_p t$$

$$x = A \cos(\omega_p t + \psi)$$

$$A = \frac{f}{\sqrt{(\omega_0^2 - \omega_p^2)^2 + 4\delta^2 \omega_p^2}}$$

$$\frac{dA}{d\omega_p} = 0 \quad \omega_r = \sqrt{\omega_0^2 - 2\delta^2}$$

共振频率

$$\omega_r = \sqrt{\omega_0^2 - 2\delta^2}$$

共振振幅

$$A_r = \frac{f}{2\delta\sqrt{\omega_0^2 - \delta^2}}$$

共振现象及
应用
